

AgruLock

Vertical Sealing (VS) System

Ideal for use where contaminated groundwater must be contained or treated by “gate and fence” systems, or at construction sites where the groundwater table must be kept at a constant low level. The AgruLock Vertical Sealing Lock System creates an impermeable layer between and allows percolation only at panel joints. The System is easy to install at construction sites; the HDPE material profile is easily welded with any hot wedge welding machine.

The new AGRULOCK C-Evolution gives the advantage to supply it in rolls up to 45m, that means tailor-made to the customer requirements. The 130mm welding section of the profile ensures weldability with any common hot wedge welding machine.

Benefits of AgruLock Vertical

- Horizontal separation load greater than 15 kN/m run of interlock
- The interlock has outstanding high horizontal elongation properties
- A customizable profile length
- Designed for tough working conditions
- Easy, simple assembly at construction site
- Option to fill the box section with a special sealing compound
- Identical male and female profile
- Made of HDPE
- Option to install with frame or coiling drum
